

The shooter's ballistics and record platform.

A precision-ballistics and firearms-record application for the target, sport and hunting market — pairing a firing solution you can audit to four decimal places with the complete, lawful record of a shooter's firearms, ammunition and range activity, held entirely on their own device.

THE PLATFORM

The solution. The app displays and explains the firing solution — every factor, Coriolis drift included, shown with its full working. Nothing is a black box: the shooter can check the number because the maths is on the page.

The record. Certificate → armoury → ammunition → range log, in one place and aware of UK firearms law (FAC, shotgun and explosives certificates), serving factory shooters and handloaders alike. A guided setup takes a new user from ticket to first firearm in one run.

The reference. A bundled, versioned catalogue of ammunition, bullets, powders, primers, cases and cartridge standards — corrected and expanded over-the-air, with no app-store release required to ship new data.

WHO IT'S FOR

Target and club shooters, stalkers and hunters, and reloaders who develop their own — from a first-time certificate holder to a competitor logging every round. One app serves the factory-ammunition shooter and the handloader alike, revealing only what each actually needs.

WHAT SETS IT APART

- ◆ **Private by design.** No account, no cloud. Personal and firearms data never leave the device.
- ◆ **Scrutiny-proof physics.** A documented 3-DOF point-mass model, validated against published maker and doppler data.
- ◆ **On-device target scanning.** Photograph a group; measure centre, spread and MOA by computer vision.
- ◆ **Crowd-improved data.** Anonymous, consensus-validated catalogue corrections reach every user in minutes.
